## Introduction

The Center for Health Information and Analysis (CHIA) contracted with SSRS and its subcontractor, the Urban Institute, to conduct the 2014 Massachusetts Health Insurance Survey (MHIS). The goal of the MHIS is to document health insurance coverage and access to and use of health care for the non-institutionalized population in Massachusetts. This report provides information about the methods used to collect and analyze the 2014 MHIS data as well as a description of changes made to the methodology and questionnaire since 2011 when MHIS was last fielded.

## Overview of the MHIS

The MHIS questionnaire begins by establishing that the household is included in the survey sample frame, namely that it is in Massachusetts. The survey then asks for a person aged 18 or older who can answer questions about the health insurance coverage of the members of the household. That respondent is then asked questions that are used to create a roster of every individual in the household by age, gender, education, work status, and relationship to the respondent. Persons temporarily living away from home (including college students) are included in their usual household. Persons living in group quarters (e.g., dorms, nursing homes, and shelters) are excluded from the study as the focus is on the non-institutional population in the state.

From the household roster, one household member is randomly selected by the computer program to be the “target” person for the household. Basic information (including demographic and socioeconomic characteristics and insurance status) are collected on all of the members of each selected household, with more detailed information collected for the target person. Table 1 summarizes the topic areas covered in the MHIS for all members of the household and for the household member selected as the target individual for the survey. Completion of the survey instrument in 2014 took approximately 21 minutes on average.

**Table 1: Summary of Topic Areas Covered in the MHIS, by Household Members**

Topics	Survey Respondent	All Household Members	Target Household Member	Target's Spouse (if present) and Parents (if present and Target age<26)
Demographic characteristics (age, race/ethnicity, gender, marital status)	X	X	X	X
Socioeconomic characteristics such as education	X	X	X	X
Nativity and citizenship status			X	
Length of residency in Massachusetts			X	
Health insurance coverage	X	X	X	X
Health insurance churn			X	
Detailed employment questions			X	X
Availability of employer sponsored insurance			X	X
Health status			X	
Access to and use of health care			X	
Family income			X	
Homeownership	X			
Household telephone status	X			

## Sample Design

From its inception to 2007, the MHIS relied on a random-digit-dial (RDD) landline telephone survey.<sup>1</sup> Due to the changing telephone environment in the United States, the methodology changed in 2008 to a hybrid address-based sample (ABS) combined with a landline RDD study, and this approach continued to be utilized until 2011. The MHIS was again fielded in 2014, using a dual-frame telephone sample design.

RDD landline telephone interviewing was the method of choice for most survey data collection efforts executed from the 1960s to the mid-2000s, given the strength of its randomization method (RDD), ease of administering complex questionnaires using computerized interviewing systems, thorough coverage<sup>2</sup> of the overall population (given that less than 2% of Americans lived in a household without telephone service), and relatively low cost.

In the mid-2000s, the coverage of the overall population in RDD landline surveys began to change as increasing numbers of households began relying solely on cell phones. This shift away from landline telephones called for a change in sampling strategy. The MHIS moved to a dual sample frame design that combined an RDD landline telephone sample and an address-based sample (ABS). By the end of 2008, approximately 20% of households nationally no longer owned a landline telephone (Blumberg and Luke 2013). The goal of the ABS was to capture households without landline phones, such as cell phone-only households, and non-telephone households, supplementing the landline sample of the traditional RDD landline survey.<sup>3</sup>

Since 2008, there have been rapid changes in survey research, requiring another reevaluation of the sampling design. Cell phones have become more prevalent, with 39% of Massachusetts households in the U.S. estimated as cell-phone only in 2014. At the same time, concerns about cell phone interviewing that were commonplace in the mid-2000s, namely concerns about how to weight the data and whether interviewing on a cell phone was a generally viable method of data collection, have since been allayed.

Moreover, we have learned from studies examining the shift toward ABS samples in a number of surveys (including the MHIS), that ABS samples have tended to be significantly biased toward respondents with higher socioeconomic status (Link and Burks, 2013; Rapoport et al, 2012). Although weighting processes can do much to correct for this gap in the sample, it is still important to try to increase the numbers of interviews among lower socioeconomic status respondents, especially in a study where the main areas of interest, including health insurance coverage, correlate so highly with socioeconomic status.

---

<sup>1</sup> While most of the early MHIS relied on RDD samples, in 1998, the MHIS also included a small, in-person survey based on an area probability sample because of concerns that an RDD sample might produce biased estimates of the uninsurance rate in Massachusetts. In the 1998 survey the estimates of the uninsurance rate from the RDD sample and area probability sample were quite similar, at 7.8% and 8.2%, respectively (Roman 2007).

<sup>2</sup> Survey coverage refers to the extent to which the sample frame for a survey includes all members of the target population. A survey design with a gap in coverage raises the possibility of bias if the individuals missing from the sample frame (e.g., households without landline telephones) differ from those in the sample frame.

<sup>3</sup> One limitation of both the AB sample and the RDD sample, and all surveys that are conducted only through telephone, is that they will miss homeless persons in the state. This is estimated to be less than 1% of the population.

Therefore, for the 2014 survey, a dual-frame RDD landline and cell phone sample was used. As such, the survey was completed entirely by telephone, dialing both landline and cell phone numbers, with no surveys completed on the web or on hard-copy, as had been the case in 2008-2011.

While this design is better at facilitating interviews with the young as well as persons of low socioeconomic status, it is noted that such a design, at the state level, cannot cover residents of Massachusetts who purchased their cell phones out-of-state. Cell phone numbers for the study are sampled by telephone exchanges that are within the boundaries of the Commonwealth of Massachusetts. However, the potential bias from this omission is minimal since analysis of the SSRS large scale omnibus national dataset finds that only nine percent of cell phone owners in the state have cell phones with outside area codes, and three out of five such persons own a landline phone and so are covered by the landline frame. The overall loss in coverage is therefore about 4%, and research has shown that while there are some differences between such persons and persons with cell phone area codes consistent with their state of residence, they are small and largely corrected for in weighting (Dutwin, 2012).

Due to the very low incidence of being uninsured among the Massachusetts population, two other measures were employed in the sample design to increase the number of uninsured interviewed in the MHIS:

#### **1) Oversample of Prepaid Cell Phone Numbers**

Prepaid cell phones are different from a standard contract phone in that customers pay as they go, using a line of credit to use the phone. They are charged based on usage as opposed to paying a monthly fee as part of a long-term contract. Research conducted by SSRS nationwide finds that owners of prepaid cell phones are more than twice as likely to be uninsured, to have lower incomes, and to be non-white (Dutwin, 2014). By sampling these numbers at a higher rate than other cell phones, that is, oversampling the prepaid cell phone numbers, the number of respondents who fall within these categories is higher than a simple random sample.

#### **2) Stratification of Landline Sample by Income Level**

The landline sample is divided into three equivalent strata by landline telephone exchange: Lower Income, Middle Income, and Higher Income. These strata were created by listing all phone exchanges in MA in order by the mean income for the area covered by each telephone exchange. The lowest third comprise the low-income stratum, the middle third, the middle, and the highest third, the high income stratum. The three strata were sampled using a ratio of 50:30:20, again in order to oversample those most likely to report being uninsured by sampling members in lower-income areas. Survey weights corrected for oversampling in both the cell phone and landline frames.

## Instrument Development

The survey instrument used for the MHIS relies on the Coordinated State Coverage Survey (CSCS), developed by the State Health Access Data Assistance Center (SHADAC) at the University of Minnesota.<sup>4</sup> Modifications to the CSCS design were made to address issues specific to Massachusetts as well as to simplify the structure of the survey that was previously designed for a mail instrument as well (2008-2011). A number of the survey questions on access to and use of care in the MHIS were drawn from the Massachusetts Health Reform Survey (MHRS), a survey of working-age adults in Massachusetts conducted by the Urban Institute and SSRS since 2006, with funding from the Blue Cross Blue Shield of Massachusetts Foundation and, in some years, the Robert Wood Johnson Foundation and the Commonwealth Fund.<sup>5</sup> The MHIS survey instrument is pretested before each round of data collection as there are some changes made to the questionnaire between rounds.

### Pretest

The pretest of the Massachusetts Health Insurance Survey 2014 took place between May 1 and May 7, 2014. SSRS interviewers completed 23 interviews with respondents from low-income and cell phone samples. These two sample types were used in order to increase the likelihood of completing an interview with an uninsured respondent. One uninsured interview was completed. In general, respondents seemed to understand the questions as intended. The respondents seemed engaged and interested in the subject-matter. After minor adjustments to the Computer-Assisted Telephone Interview (CATI) program and a selection of additional issues noted for interviewer training, the project moved forward to fielding.

### Changes to the 2014 Instrument

Several changes were made to the survey instrument prior to fielding in 2014. These changes reflected shifts in topic priorities over time and the need to account for changes in the health insurance landscape in Massachusetts and the nation resulting from the implementation of the Patient Protection and Affordable Care Act. Below is a comprehensive list of modifications to the 2014 questionnaire.

#### Additions:

1. A question for cell phone sample respondents indicating whether the respondent is driving.
2. Confirmation of the zip codes of all respondents.
3. Two questions to assess the degree of churning between insurance and uninsurance in the past 12 months among respondents.
4. Question D3 for those who report being more than one race requesting that the respondent reports which group best represents their race.
5. Question D9 was added to indicate ancestry or heritage for those who reported being Hispanic or Asian.

---

<sup>4</sup> For a description of the CSCS, see <http://www.shadac.org/content/coordinated-state-coverage-survey-cscs>. We thank Kathleen Call at SHADAC for sharing the CSCS and helping to modify it for the MHIS.

<sup>5</sup> For a description of the MHRS, see [http://www.urban.org/health\\_policy/url.cfm?ID=411649](http://www.urban.org/health_policy/url.cfm?ID=411649).

**Deletions:**

1. Questions asking what type of housing unit the respondent lived in and for the phone number that can be used to reach the main residence.
2. All references to the Free Care pool.
3. A question asking about whether the patient had had a recent hospital stay.
4. Questions asking about particular aspects of health reform in Massachusetts that are no longer relevant given the current landscape.
5. A question asking about receiving a tax penalty for not having health insurance coverage.

**Modifications:**

1. A question asking whether the residence is a second home or vacation home was modified to ask if the home is located in Massachusetts.
2. Due to changes to the public health care programs offered in Massachusetts as part of the Affordable Care Act implementation, the insurance types were updated. This included: removing references to the Medical Security Program, adding Temporary Coverage while an application for coverage is being processed, adding Connector Care and its definition, and adding a Health Connector Plan to the list of potential insurance types as a catch-all for insurance purchased through the exchange.
3. The format for asking about insurance coverage of other household members was changed to be read as a single list instead of as individual questions for each insurance type. The purpose of this change was to save interview time for new questions. This procedure was adopted from formats used in Colorado and Minnesota in health insurance studies carried out by SSRS.
4. Questions about phone access and use were changed to reflect the new cell phone sample frame.
5. The definition of family was changed to include 19-26 year-olds living with their parents or temporarily absent from the household as “children,” since the age of eligibility has changed for being covered on a health insurance plan of a parent or guardian.

## Data Collection Strategy

Data collection for the 2014 MHIS began on May 14, 2014, and was completed on July 30, 2014.

### Languages

In the past, the MHIS was administered in three languages--English, Spanish, and Portuguese. Due to a decreasing number of respondents requesting to complete the survey in Portuguese, this language option was eliminated in 2014, and the survey was offered only in English and Spanish. Table 2 shows the number of interviews conducted in each language between 2008-2011 and 2014. Spanish interviews were conducted by bilingual interviewers who are able to switch back and forth between languages as necessary. The increase in Spanish interviews in 2014 is the result of adding a cell phone frame to the sample design. In many landline/cell phone studies, the majority of Spanish-language interviews are completed via cell phone given that Hispanics far outpace non-Hispanics in only owning cell phones (Blumberg and Luke, 2013). Similarly, for the 2014 MHIS, 104 of the 141 Spanish-language interviews were conducted from the cell phone sample frame.

**Table 2: Number of Completed Interviews by Language of Interview**

Survey Year	Language of Interview			Total Sample
	English	Spanish	Portuguese	
2008	4,817	77	16	4,910
2009	4,855	47	8	4,910
2010	4,436	37	5	4,478
2011	3,953	48	2	4,097
2014	3,883	141	N/A	4,024

## Training Materials and Interviewer Training

Interviewers received both written materials about the survey and formal training for conducting this survey. The written materials were provided prior to the beginning of the field period and included:

1. An annotated questionnaire that contained information about the goals of the study as well as detailed explanations of why questions were being asked, the meaning and pronunciation of key terms, clarification of any potential points of respondent confusion, and other problems that could be anticipated ahead of time as well as strategies for addressing them.
2. A list of frequently asked questions and the appropriate responses to those questions.
3. A script to use when leaving messages on answering machines.
4. Contact information for project personnel.

Call center supervisors and interviewers were walked through each question in the questionnaire. Interviewers were given instructions to help them maximize response rates and ensure accurate data collection. They were instructed to encourage participation by emphasizing the social importance of the project and to reassure respondents that the information they provided was confidential.

Interviewers were monitored during the first several nights of interviewing and provided feedback where appropriate to improve interviewer technique and clarify survey questions. The interviewer monitoring process was repeated periodically during the field period.

## Call Rules for the CATI Interviews

For all sample members, the initial telephone interviewing attempt included one initial call plus six callbacks. If an interview was not completed at that point, the telephone number was set aside for at least two weeks to “rest.” After that rest period, an additional three callbacks were attempted. While in previous waves, we had completed up to 15 callbacks on each piece of sample, the number had to be reduced in 2014 due to a shorter field period. Overall, households received at least 10 call attempts. To increase the probability of completing an interview, we established a differential call rule that required that call attempts be initiated at different times of the day and different days of the week.

## Refusal Avoidance and Conversion Strategies

In addition to the call rules for the CATI interviews, we employed several other techniques to maximize the response rate for the survey. Respondents who refused to continue at the initiation of or during the course of the telephone interview were offered the opportunity to be re-contacted at a more convenient time to complete the interview.

Another method to increase responses rates is refusal conversions. Though all of SSRS's interviewers regularly go through "refusal aversion" training, refusals are still a regular part of survey research. For the 2014 MHIS, SSRS used a core group of specially-trained and highly-experienced refusal conversion interviewers to call all respondents who initially refused the survey in an attempt to persuade them to complete the survey.

## Completed Interviews

Table 3 shows the number of completed interviews, for households that had only a cell phone, only a landline phone, or both a landline and cell phone in 2014. As expected given the changing design, the proportion of completed surveys from cell phone-only households has increased (see Section VII). In 2014, we completed surveys with 905 cell phone-only households, 2,655 landline and cell phone households, and 286 landline-only households. One-hundred-seventy-eight respondents did not provide sufficient information to determine household phone status.

Table 3: Phone Status of Survey Respondents in 2014 MHIS					
	Landline Only	Cell Phone Only	Both Landline and Cell Phone	Other*	Total
Total Completed Surveys	286	905	2,655	178	4,024
Percent of Total Completed Surveys	7.1%	22.5%	66.1%	4.4%	100.0%

\*This category includes those who said they did not know or refused to answer questions that would have determined their phone status.

## Data Processing and Preparation

An analytical data file was created from the raw unedited survey data. This was a target-level file that included all data elements collected for the target person in the household along with data on the characteristics of the target's family and household. CATI range and logic checks were used to check the data during the data collection process. Additional data checks were implemented as part of the data file development work, checking for consistency across variables and family members, and developing composite measures of family and household characteristics.

Missing values for key demographic variables, such as age, race/ethnicity, health and disability status, and family income were replaced through imputation in both files. Missing values were also imputed for all variables provided in the tables generated from the data. For the variables for which imputed data were created, the data files include both the original variable (with missing values) and a new variable that includes the imputed values for cases that had missing values. In general, the percent of respondents who answered don't know or refused to any given question was quite low; however, item nonresponse for family income was somewhat

higher. Roughly 14% of the total sample was missing all data on the income questions, while another 4% provided information on whether family income was above or below 300% of the federal poverty level but not any additional information. The level of non-response for income was higher among landline respondents (15.1%) than among those interviewed on a cell phone (7.8%).

In imputing values for the variables, we rely on hot deck and regression imputation. More details on these procedures are provided in Appendix A.

## Response Rates

Response rates are one method used to assess the quality of a survey, as they provide a measure of how successfully the survey obtained responses from the sample. The American Association of Public Opinion Research (AAPOR) has established standardized methods for calculating response rates (AAPOR, 2008). Overall response rates achieved for the landline and cell phone samples and the overall survey sample are reported below. Before presenting those estimates, methods for calculating the response rates are described.

While response rates provide an indicator of potential bias in a survey (which can arise when survey nonrespondents are significantly different than respondents), lower response rates are not, in and of themselves, an indicator of survey quality since lower response rates do not necessarily increase nonresponse bias in surveys (Groves 2006; Groves and Peytcheva 2008). This issue has been addressed in a number of studies, including, for example, Keeter and colleagues (2000), who compared the results of a 5-day survey fielding period (response rate of 36%) to the results from fielding the same survey for 8 weeks (response rate 61%), and found no significant differences between the two surveys in the outcomes of interest. Thus, differences in the response rate between the 2011 and 2014 MHIS 37.3 percent and 30.9 percent, respectively, are not necessarily indicative of differences in the accuracy of the data available from the surveys.

## Defining the Response Rate

AAPOR Response Rate #3 was calculated for this study. Response rate three is generally defined as the number of households in which an interview was completed divided by the estimated number of eligible households in the sample. With a landline number, the interviewer would ask to speak with someone in the household who was able to answer questions about everyone else's health insurance. Cell phone numbers are considered to be a respondent's personal communication device, and as such, if the respondent could not answer questions about insurance in the household, the interview was terminated rather than handed off to another household member.

In estimating the response rate for the MHIS, AAPOR defines four categories of sample records (telephone numbers):

1. Eligible, completed interview
2. Eligible, no interview
3. Unknown if eligible
4. Not eligible

Cases in which no interview was attained from an eligible household include persons who refused to be interviewed and those who broke off the interview part way through, as well as any other sample record that was determined to be a household (e.g., an answering machine

indicated that it was a household and not a business). AAPOR category three includes all sample records for which eligibility is unknown, such as sample records that result in a “no answer” (continuous ringing with no answering machine). In calculating a response rate, an eligibility quotient to this category is applied. This is a percent of the sample records in the category that was estimated to be eligible households. Finally, AAPOR category four includes sample records that are known to be ineligible, such as business numbers, fax machine numbers, non-working numbers, and vacant or second homes.

Final response rates are summarized in Table 4. The response rates for the landline and cell phone samples in the 2014 MHIS were 32.4% and 27.7%, respectively. The overall response rate for the 2014 MHIS was 30.9%.

Table 4: Response Rate for 2014 MHIS	
Sample	Response Rate
Landline Telephone	32.4%
Cell Phone	27.7%
Total	30.9%

## Survey Weights and Variance Estimation

### Survey Weights

Survey data were weighted to adjust for differential sampling probabilities, to reduce biases due to differences between respondents and non-respondents (nonresponse bias), and to address gaps in coverage in the survey frame (coverage bias). Survey weights can reduce the effect of nonresponse and coverage gaps on the reliability of the survey results (Keeter et al. 2000, 2006; Groves 2006). Overall, the procedure executed for this study follows the essential two-step procedure detailed in Kalsbeek and Agans (2008), which is to first correct for any disproportionate probabilities of selection (base weighting), such as oversampling pre-paid cell phones as noted earlier, and second to then balance the sample to match official statistics for persons living in Massachusetts on metrics such as age and gender (post-stratification). A more detailed explanation is provided below.

### Constructing the Base Weights

The base weighting process is designed to correct for disproportionate probabilities of selection. While telephone numbers are generated by RDD, disproportionate probabilities are introduced into surveys because 1) the number of separate telephone landlines and cellphones answered by respondents differ by household and by telephone frame, 2) of the purposive disproportionate selection of sampling strata noted earlier (for landlines, high, medium and low income; for cell phones, prepaid and non-prepaid phones), and finally, 3) landlines are often shared by multiple respondents while cell phones are considered personal devices. Each of the sub-steps to base weighting that address these issues are provided below:

- (1) *Telephone frame and usage corrections:* A phone number's probability of selection for the survey depends on the number of phone numbers selected out of the total sample frame. So for each landline number, the probability of selection is calculated as total landline numbers dialed divided by total numbers in the landline frame. For cell phones, probability is calculated as total cell phone numbers divided by total numbers in the cell phone frame. In addition, the probability that the sampling unit (households on landlines or respondents on cell phones) will be reached is a product of the number of phones (by type) a respondent or their household answer.
- (2) *Disproportionate stratification corrections:* The number of sample records utilized is balanced back to the percent of sample records that exist in each stratum. For example, while 16.4 percent of cell phones are prepaid phones in Massachusetts, 41 percent of the sample used for the project consisted of prepaid phones and thus the base weight correction here for prepaid phones is .4 (16.4 / 41).
- (3) *Probability of Respondent Selection:* In households reached by landline, a single respondent is selected. Thus, the probability of selection within a household is inversely related to the number of adults in the household. In respondents reached by a cell-phone, the probability of selection is one.

The final base weight is a product of the above noted corrections.

## Post-stratification

With the base-weight applied, the sample was post-stratified using iterative proportional fitting (IPF) (Deming, 1943), whereby the sample was balanced to match known adult-population parameters based on the most recent U.S. Census Bureau's American Community Survey (ACS), which was 2012 for the 2014 MHIS.

The targets used for post-stratification are the non-institutionalized population of Massachusetts for the following parameters: age (0-17; 18-29; 30-49; 50-64; 65+) by gender, region (Western MA; Southcoast; Northeast MA; Metro West; Metro South; Metro Boston; Central MA; Cape and Islands), education (less than high school, high school graduate; some college; four-year college; graduate degree), race/ethnicity (white non-Hispanic; black non-Hispanic; Hispanic; other race non-Hispanic), population density in zip/county (divided into quintiles), born in the U.S., and phone-usage (cell phone only, landline only, both landline and cell phone).<sup>6</sup> These parameters along with unweighted and weighted percents are listed in Table 5.

---

<sup>6</sup> The cell phone only rate for Massachusetts is based on a linear projection to 2014 from data on the percent of Massachusetts households that are cell-phone only as reported in the National Health Interview Survey in 2007, 2009, and 2011 (Blumberg et al. 2012).

Table 5: Benchmarks, Unweighted and Weighted Targets				
Parameter	Value Label	Benchmark	Unweighted	Weighted
		(%)	(%)	(%)
Age	0-17	21.9	11.3	21.7
	18-29	15.4	12.7	15.0
	30-49	27.4	21.0	26.7
	50-64	20.9	29.2	20.6
	65+	14.3	23.4	14.0
Education	Less than High School	8.0	8.2	7.9
	High School Graduate	20.5	23.0	20.2
	Some College	20.4	21.6	20.2
	College+	29.4	36.0	29.4
	Target<16	21.8	9.9	20.8
Ethnicity	White	76.5	73.0	73.6
	African American	6.7	6.7	6.1
	Hispanic	10.1	11.1	10.0
	Other	6.6	6.0	6.5
Density	Quintile 1	20.0	20.5	19.7
	Quintile 2	20.0	17.1	19.8
	Quintile 3	20.0	19.2	19.7
	Quintile 4	20.0	20.6	19.1
	Quintile 5	20.0	19.7	19.9
Gender by Age	Male 0-17	11.1	5.7	11.0
	Male 18-29	7.7	6.6	7.3
	Male 30-49	13.3	10.6	13.1
	Male 50-64	10.0	13.3	9.8
	Male 65+	6.1	9.9	6.0
	Female 0-17	10.8	5.6	10.6
	Female 18-29	7.7	6.1	7.7
	Female 30-49	14.1	10.4	13.6
	Female 50-64	10.9	15.9	10.8
	Female 65+	8.2	13.5	8.2
Phone Status	Cell phone only	39.0	22.9	38.8
	Landline only	10.0	7.7	9.9
	Dual Frame	51.0	69.4	51.3

<b>Region</b>	Western MA	12.3	14.8	12.2
	Central MA	11.3	12.5	11.2
	Northeast MA	21.5	19.9	21.3
	Metro West	10.0	7.5	9.9
	Metro Boston	23.9	22.4	23.5
	Metro South	12.3	10.1	12.2
	Southcoast	5.1	6.9	5.1
	Cape and Islands	3.6	4.4	3.5

\* Categories may not add to 100% due to item nonresponse

## Weight Truncation

To minimize the potential impact of very large weights on survey estimates, the weights were truncated (or ‘trimmed’) so that they did not exceed 8.0 or fall below under 0.2. Weights were trimmed to the hard limits of 8 and .2, and then the difference in the sum of the weights of the trimmed weight and the untrimmed weight was proportionately redistributed to all cases.

## Variance Estimation and the Average Design Effect

Complex survey designs and post-data collection statistical adjustments affect variance estimates and, as a result, tests of significance and confidence intervals. Variance estimates derived from standard statistical software packages that assume simple random sampling are generally too low, which leads significance levels to be overstated and confidence intervals to be too narrow.

The impact of the survey design on variance estimates is measured by the design effect. The design effect describes the variance of the sample estimate for the survey relative to the variance of an estimate based on a hypothetical random sample of the same size. In situations where statistical software packages assume a simple random sample, the adjusted *standard error* of a statistic is calculated by multiplying by the square root of the design effect. In 2014, the average design effect for estimates for the target person in the household is 1.91. Based on that design effect, the sampling error for estimates for outcomes that occur for about 50% of the sample will be +/-1.54 percentage points based on the target person sample in 2014. For outcomes that occur for 90% or 10% of the sample, the sampling error based on the target sample is +/- .93 percentage points in 2014.

The samples selected for each year of the study are independent and therefore variation in design effects and hence the sampling error is expected from year to year. The design effect and sampling error are summarized in Table 6.

Table 6: Design Effect and Sampling Error			
Average Design Effect	Sampling Error (95% CI, Prob.=.5)	Sampling Error (95% CI, Prob.=.1)	Sample Size
1.91	1.54	.93	4,024

Variance estimation procedures have been developed for most standard software packages to account for complex survey designs. A replicate stratum (strata) variable on the survey data files that can be used with the appropriate weight variable to obtain corrected standard errors using a Taylor series approximation (or other related linearization method) is provided in the data file. Users interested in using a linearization method can choose to use SUDAAN, the “SVY” commands in Stata, the “PROC SURVEYMEANS” and “PROC SURVEYREG” commands in SAS, or the “CSELECT” complex samples procedures in the SPSS complex samples module.

## Estimates of the Uninsurance Rate for Massachusetts

Table 7 shows the estimate of the uninsurance rate for Massachusetts residents based on the 2014 MHIS target sample, by sample frame and overall.

Table 7: Estimate of the Uninsurance Rate from the 2014 MHIS, by Sample Frame			
	Landline Sample	Cell Phone Sample	Total
Sample size	1,987	2,037	4,024
Number Uninsured	46*	76	122
Percent Uninsured (data are weighted)	2.4%	4.6%	3.7%

\*Note: The estimate of the uninsurance rate is based on a small number of uninsured persons in both the landline sample (46) and the cell phone sample (76). Therefore, analysis of uninsured is more accurate when conducted on total overall sample only and not by frame.

## Appendix A: Imputation

Missing data are ubiquitous throughout social science research and can be found in almost all large survey datasets. Replacing the missing values with plausible substitutes (imputation) occurred for survey data in the United States as early as the 1930s. A wide variety of techniques have been developed since that time. Two modern methods, hotdeck and modelled (regression) imputation, have emerged as general and widely used techniques for analysis in the presence of missing data.

Hotdeck imputation sorts data by user-entered variables and takes data from the “nearest neighbor” and imputes it into a missing case. The key idea of modelled imputation is that missing values are imputed with plausible values drawn from the conditional distribution of the missing data given the observed data under a specified model. These procedures can then produce a series of more “complete” datasets which can then be used for analysis.

Hotdeck imputation is standard procedure at SSRS for creating weighting variables devoid of missing data, to allow for iterative proportional fitting procedures for weighting as noted elsewhere in this report. For 2014, modelled imputation was added to key variables that were also created for the detailed tables.

Hotdeck was specifically utilized for race/ethnicity, age, region, U.S. born status, education, and population density. Data were sorted by phone status (landline only, dual user, and cell phone only).

The modelled imputation utilized the impute missing values procedure in SPSS advanced statistics, which employed regression for imputation with ten iterations specified. Because there were a number of variables to be imputed, a common model was developed with imputations generated in batches. The first model imputed the following variables: age, gender, race, ethnicity, citizenship, language of interview, health status, limited health activities, highest family education, family work status, family work status size, federal poverty level, health insurance status, time insured, and homeownership. These variables then became the basis for the common model that was utilized to impute subsequent variables. Variables were of course limited and constrained where necessary to avoid contradictory imputed values (for example, health disability is a combination variable of being disabled and being limited due to health, and thus if a case was imputed to be limited in the limited variable, that person should need to be limited in the health disability variable as well). Below is a report of the missing values of the variables that were imputed by either hotdeck or the modelled imputations.

Description	Missing Values	Total Valid Responses	Missing Percent
Age of Target	99	4,024	2.5%
Gender of Target	2	4,024	0.04%
Race of Target	131	4,024	3.3%
Target's Citizenship Status	1	4,024	0.02%
Target's Health Status	30	4,024	0.7%
Has a Health-Related Disability	49	4,024	1.2%
Highest Educational Attainment in Family	46	4,024	1.1%
Federal Poverty Level	746	4,024	18.5%
Region of Massachusetts	63	4,024	1.6%
Target is Limited by Health Problem	47	4,024	1.2%
Home Is Owned	163	4,024	4.0%
Health Insurance Status - 12 Months	37	4,024	0.9%
Had Insurance for Less than 6 Months	37	4,024	0.9%
Insured for all of Past 12 Months	19	4,024	0.5%
Insured Now, Uninsured at Some Time in Past 12 Months	19	4,024	0.5%
Insured Now and for all of the Past 2 Years	122	4,024	3.0%
Insured Now and for all of the Past 5 Years	122	4,024	3.0%
Target Became Insured After Being Uninsured	177	4,024	4.4%
Target Transitioned From One Type of Insurance to Another	177	4,024	4.4%
Target was Insured for Any of the Last 12 Months	37	4,024	0.9%
Target Uninsured for Less than Six Months	37	4,024	0.9%
Target Uninsured for Six Months or More	37	4,024	0.9%
Target Uninsured for all of the Past 12 Months	37	4,024	0.9%
Target Uninsured Now but Insured in Past 12 Months	37	4,024	0.9%
Target has a Reason for Uninsurance Related to Cost	14	122	11.5%
Veteran's Insurance	38	4,024	0.8%
Usual Source of Healthcare is Not the ER	90	4,024	2.2%
Has Visited a General Doctor or Specialist in the Past 12 Months	36	4,024	0.9%
Has Visited a General Doctor in Past 12 Months	83	4,024	2.1%
Had a Visit for Preventive Care	21	4,024	0.5%
Visited a Specialist in the Past 12 Months	75	4,024	1.9%
Had a Dental Visit in Past 12 Months	41	4,024	1.0%
Took Prescription Drugs in Past 12 Months	55	4,024	1.4%
Had an ER visit in Past 12 Months	46	4,024	1.1%
Had More than One ER Visit in Past 12 Months	46	4,024	1.1%
Told By Doctor or Clinic that Insurance Wasn't Accepted in Past 12 Months	46	4,024	1.1%
Told By Doctor or Clinic that they Were Not Accepting New Patients In Past 12 Mo.	56	4,024	1.4%
Had Problem Getting an Apt. w/ Doctor/Clinic as soon as Needed in Past 12 Mo.	55	4,024	1.4%
Visited ER for Non-Emergency Condition	42	2,792	3.4%
Visited ER Because Unable to Get Doctor's Appointment	2	449	0.4%
Visited ER Because Needed Care After Normal Doctor Hours	4	449	0.9%
When Choosing a Provider Gets Info from a Gov't Agency or the Internet	48	4,024	1.2%
Cost was a Major Factor in Choosing a Doctor	118	4,024	1.2%
A Quality Rating was a Major Factor in Choosing a Doctor	71	4,024	1.8%
Cost and Quality Or a Rating was a Major Factor in Choosing a Doctor	305	4,024	7.6%

Out of Pocket Costs Under \$1,000	213	4,024	5.3%
Out of Pocket Costs Under \$3,000	213	4,024	5.3%
Had Problems Paying Medical Bills in Past 12 Months	15	4,024	0.4%
Changed to Lower Cost Doctor	8	1,411	0.6%
Went Without Needed Health Care	7	1,411	0.5%
Switched to a Lower Cost Insurance Plan	11	1,411	0.8%
Went Without Health Insurance	4	1,411	0.3%
Tried Harder to Stay Healthy	4	1,411	0.3%
Other Lower Spending Approach	7	1,411	0.5%
Target Employment	44	3,648	9.3%
Target's Spouse's Employment	21	1,553	1.4%
Target's Father's Employment	9	3,513	1.8%
Target's Mother's Employment	6	3,368	1.0%
Person who had Insurance Lost Job or Changed Employers	8	3,902	0.2%
Person who had Insurance No Longer Member of Family	10	3,902	0.3%
Employer Does not Offer Coverage	13	3,902	0.3%
Lost Eligibility for Public Program	19	3,902	0.5%
Cost is too High	14	3,902	0.4%
Doesn't Need Insurance	10	3,902	0.3%
Doesn't Know How to get Insurance	12	3,902	0.3%
Traded Health Insurance for Another Benefit or Higher Pay	13	3,902	0.3%
Other Reason	10	3,902	0.3%

# Appendix B: Survey Instrument

## Massachusetts Health Insurance Survey

**INTRO1.** Hello. My name is \_\_\_\_\_ and I'm calling on behalf of the Commonwealth of Massachusetts. I'm with SSRS.

(INTERVIEWER SHOULD CONFIRM THAT RESPONDENT IS 18 OR OLDER. OTHERWISE ASK TO SPEAK WITH SOMEONE IN THE HOUSEHOLD WHO IS 18 OR OLDER)

(DELETED INTRO FOR OTHER USPS SAMPLE 4-3)

ASK CELL1, CELL2, CELL 2a, CELL3 OF CELL PHONE SAMPLE ONLY)

CELL1. Just so that I can ask you the right questions, could you please tell me if you are less than 18, 18 to 25, 26 to 64, or 65 or older?

- |   |                          |                                   |
|---|--------------------------|-----------------------------------|
| 1 | Less than 18             | THANK AND TERM, RECORD AS TQCELL1 |
| 2 | 18 to 25                 | CONTINUE TO CELL2                 |
| 3 | 26 to 64                 | CONTINUE TO CELL2                 |
| 4 | 65 or older              | CONTINUE TO CELL2                 |
| D | (DO NOT READ) Don't know | THANK & TERM, RECORD AS TQCELL1   |
| R | (DO NOT READ) Refused    | THANK & TERM, RECORD AS RQCELL1   |

IF CELL1 = 1,D or R READ: Thank you. We are only interviewing people who are 18 years old or older.

(ASK IF CELL SAMPLE)

CELL2. What is your zip code?

(IF NEEDED: If you have more than one residence, please tell me the zip code of your primary residence.)

\_\_\_\_\_ (ENTER ZIP CODE)

NN Outside of Massachusetts (not on list)

DD (DO NOT READ) Don't know

RR (DO NOT READ) Refused

(ASK CELL2a IF CELL2=NN, DD, RR)

CELL2a. Is your home located in Massachusetts?

1 Yes

2 No

3 (DO NOT READ) DON'T KNOW

R (DO NOT READ) REFUSED

GO TO CELL 3

THANK AND TERM

RECORD AS TQCELL2A

THANK & TERM. RECORD

AS TQCELL2a

**INTRO2.** As you may know, Massachusetts is one of several states taking the lead in finding ways to make health care more affordable and easier to obtain. The state would like to better understand how to improve access to affordable health insurance.

Your telephone number was randomly selected from phone numbers in Massachusetts. Your participation in this study is voluntary and will be a great help. This study takes only about 25 minutes. (IF NEEDED: It tends to be a bit shorter for smaller households and a bit longer for larger households)

DELETED VERBIAGE FOR OTHER USPS SAMPLE WITH LISTED LL PHONE AND  
REMAINING USPS SAMPLE

**INTRO3.** Before we start, let me tell you that everything you say will be kept private. Your answers will be combined with those of other people in Massachusetts. The study will not be used for marketing purposes and your decision whether or not to participate will not have any effect on anything to do with your insurance coverage, health care, or your relationship with any state or Federal agencies. You may skip over questions or stop the interview at any time you wish.

**IF RESPONDENT RAISES CONCERNS ABOUT THE INDIVIDUAL MANDATE:** Since all of the information that you provide will be kept private, there is no way that anything you say could be used to determine whether you are complying with the individual mandate on insurance coverage.

**INTRO4.** If you have questions about the study, I can give you a phone number now or at the end of the survey that you can call to find out more about the study.

For questions about the survey, please call Kathy Langdale at 1-800-633-1986.

To speak with someone from the agency responsible for this survey, please call Catherine West at 617-988-3149

(DELETED ORIGINAL S1A, S5, S1B, 4-3-14)

## HEALTH REFORM

### BACKGROUND

Now, I'd like to ask a few questions to help us describe the people who participated in our survey.

(ASK EVERYONE)

INSERT "Are you" IF PERSON ASKING ABOUT IS RESPONDENT

INSERT "Is TARGET" IF PERSON ASKING ABOUT IS "TARGET PERSON"

D1. (Are you/IsTARGET) Hispanic or Latino?

- 1 Yes
- 2 No
- D (DO NOT READ) Don't know
- R (DO NOT READ) Refused

(ASK EVERYONE)

INSERT "your" IF PERSON ASKING ABOUT IS RESPONDENT

INSERT "TARGETs" IF PERSON ASKING ABOUT IS "TARGET PERSON"

D2. Which one or more of the following would you say is (your/TARGETs) race?  
(READ LIST. ENTER ALL THAT APPLY)

- 1 White
- 2 Black or African American
- 3 Asian
- 4 Native Hawaiian or Other Pacific Islander
- 5 American Indian or Alaska Native
- 7 Or some other race (SPECIFY)\_\_\_\_\_
- D (DO NOT READ) Don't know
- R (DO NOT READ) Refused

(ASK D3 IF D2 IS >1 RESPONSE)

INSERT "your" IF PERSON ASKING ABOUT IS RESPONDENT

INSERT "TARGETs" IF PERSON ASKING ABOUT IS "TARGET PERSON"

D3. Which one of these groups would you say best represents (your/TARGETs) race?

PN: ONLY INCLUDE RESPONSES FROM D2

- 1 White
- 2 Black or African American
- 3 Asian
- 4 Native Hawaiian or Other Pacific Islander
- 5 American Indian or Alaska Native
- 7 Or some other race (SPECIFY) \_\_\_\_\_
- D (DO NOT READ) Don't know
- R (DO NOT READ) Refused

(ASK D4 IF D1=1 OR D2=3 OR D3=3)

(SHOW CODES 01-04, 94, 95, 97 ONLY IF D1=1 AND D2 AND OR D3 DOES NOT EQUAL 3)

IN-7[STREET]To help us insure the quality of our survey data, could you tell me the name of the street that you live on?

(IF NEEDED: If you have more than one residence, please tell me the name of the street of your primary residence.)

(IF NEEDED: We do not need your full stress address, only the name of the street that you live on.

\_\_\_\_\_ (ENTER STREET NAME)

DD (DO NOT READ) Don't know

RR (DO NOT READ) Refused

Q.X. We may follow-up with some survey participants to gather more in-depth information on their health care experiences in Massachusetts. Could we contact you again to ask a few more questions?

- 1 Yes
- 2 No
- D (DO NOT READ) Don't know
- R (DO NOT READ) Refused

(ASK Q.X2 IF Q.X1=1)

Q.X2. What would be the best way to reach you in the future?  
(RECORD ALL INFORMATION ACCURATELY)

Name: \_\_\_\_\_

Phone number for recontact: \_\_\_\_\_

Email for recontact: \_\_\_\_\_

(EVERYONE:)

FINAL: That was my last question. Do you have any questions for me?

IF NEEDED READ

For more information on health care coverage in Massachusetts, I can give you two customer service numbers:

For MassHealth, call 1-800-841-2900

For Commonwealth Care through the Health Connector, call 1-877-623-6765
